HMIS Performance and Factors Associated with Its Implementation Jun 16 2021 "Evidence-based policy and informed decision-making at all levels of the health system require quality HMIS data. The health management information system (HMIS) in Ethiopia is characterized by poor data quality and low information use for decision making. Therefore, this book is aimed at assessing the status of current HMIS performance and factors associated with its implementation in health facilities of the study area. Effective supportive supervision and health facility performance review team (PRT) functions including HMIS management and data quality checking were significantly associated with good performance. Therefore, building capacity of health workers, effective supportive supervision, strengthening Performance review team and availing HMIS supplies should be emphasized for adequate performance of current HMIS.

Factors Associated with Alcohol Use in University Students Jun 28 2022 Research into alcohol use by young people is mostly focused on adolescents, secondary or further education students rather than university students. However, alcohol drinking among university students is a widely recognized problem and represents a serious health and cultural problem, with many negative individual, interpersonal and cultural consequences. Binge drinking, an increasingly common pattern of excessive alcohol use with serious negative consequences for individual drinkers, those around them, and the university environment, is a major problem on university campuses. Alcohol consumption among youths is affected by a complex of risk and protective factors, investigation of which is essential for a better understanding and focusing of the intervention procedures. The complex linkages of risk and protective factors and problem behaviours change over time and within different cultures and countries. The importance of this kind of research for the field of prevention is obvious: If we can determine the personal and interpersonal protective and risk factors affecting alcohol-use behaviour, we can better plan preventive interventions focused on creating and enhancing the personal protective attributes. To design and develop appropriate interventions, to improve behavioural outcomes for adolescents, a better understanding of these complexities and relations is required.

*Late Stage Diagnosis of Cervical Cancer Jan 24 2022 Cervical cancer is the leading cause of cancer morbidity and mortality among Nepali women. In the context of high prevalence of late stage diagnosis of cancer in Nepal, this study was carried out to explore the factors associated with late stage diagnosis of cervical cancer and delayed treatment. This study estimated the lags in different stage of diagnostic journey of cervical cancer starting from onset of symptoms to diagnosis. Illiteracy, poor health awareness, poor health seeking behaviors, negligence of gynecological symptoms were found as the major factors contributing for late stage diagnosis. Findings of this study may support to build appropriate public health interventions to reduce the proportion of late stage diagnosis and mortality from cervical cancer.*
